L&P Platform Scale Options

The end results leadership has asked for, why the current spreadsheet approach can't deliver them with AI, the real scale of the data, and three build options compared layer by layer. VERIFIED marks figures checked against official sources; ESTIMATE marks planning estimates.

1 · END RESULTS

What leadership expects the platform to deliver

PRIMARY

Stronger proposals

- Accurate, complete, compliant proposals per RFP
- Know what was strong, what failed, what to change
- Staffing and price plans ready to approve

GROWTH

Find and convert business

- Which buyers to pursue, when, with what advantage
- Qualified next-contact list with "why now"
- Which sources and messages win customers

PROTECTION

Protect revenue and clients

- Authorization gaps and renewals flagged
- Contract economics and billing exceptions explained
- Client issues owned before renewal

READINESS

Strengthen capability

- Verified past performance ready to reuse
- Credential and eligibility gaps visible
- Partner, expansion and training plans

SHARED

Reusable intelligence

- Every bid adds knowledge for the next
- ChatGPT and Claude work from the same records
- Less repeated research and re-entry

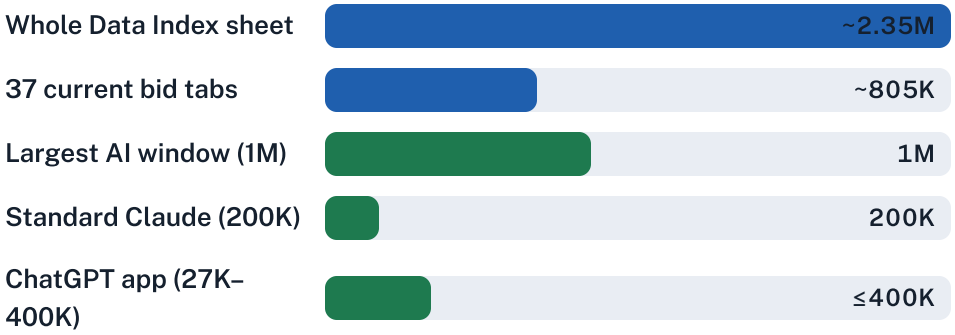

Source: Reference sheet, Overview (intended business results) and Features (human end result per section). Leadership has also asked for Pwin, market analysis and lead scoring.

2 · THE CORE PROBLEM

AI agents can’t work accurately from spreadsheets at this size

An AI model reads a limited amount of text at once (its context window). The current Data Index sheet is far larger than that, so agents read some tabs and miss the rest.

How much text, in AI tokens VERIFIED

Sheet measured 15 Oct 2026: 87 tabs, 276,873 filled cells, ~9.4M characters, at ~4 characters per token (OpenAI). Context windows from secondary comparisons (MorphLLM, AI Toolbox); they vary by model and plan.

Why agents get confused

~21,800
tokens per bid; hundreds of bids ≈ 6.5M+

34 tabs
are OLD / ARCHIVE copies holding conflicting versions

60 / min
Sheets API reads per user, so agents page tab by tab

Even when text fits, models miss facts in the middle of long inputs, and accuracy falls as inputs grow (Liu et al., TACL 2024).

> **The fix:** a database with a search index. The agent asks a precise question through a tool and gets back only the matching records, a few thousand tokens instead of millions.

Sheets API quota: Google. File size is not the issue: Sheets allows 20M cells or 100 MB per file (Google).

3 · THE REAL SCALE

A large document and AI workload on a curated dataset

Structured rows stay in the hundreds of thousands. What makes it enterprise-grade is the volume of documents AI has to read and the accuracy the results need.

DATA	VOLUME	STATUS
Federal security-guard contracts (NAICS 561612), active per year	~7,600–8,200 nationally · 343–587 in Texas · ~$5.6–6.0B obligated	VERIFIED
Competing companies (federal 561612 recipients) per year	~625 nationally · ~50 in Texas	VERIFIED
Federal solicitation notices per year (SAM.gov)	~430–480 nationally · 7–21 in Texas (lower bound)	VERIFIED
Texas state and local solicitations (ESBD, city and county portals)	~100–300 security-related per year	ESTIMATE
L&P bid history to load (hundreds of bids)	~20,000–120,000 pages · 2,000–10,000 files	ESTIMATE
New market documents to read per year (Texas focus)	~10,000–40,000 pages	ESTIMATE
Structured records	~25,000–30,000 per year · ~250,000–300,000 for a 10-year federal history	ESTIMATE

USAspending API queries for FY2024–FY2025 (API docs); SAM.gov public notice search; Texas ESBD. Competitor proposals in Texas usually need Public Information Act requests; winning contracts and prices are generally public after award, while losing proposals can be withheld or redacted.

4 · THREE OPTIONS

What each option includes, and which results it delivers

Each option builds on the one before it, on the same architecture, so nothing is rebuilt. Bold text marks what an option adds.

● Included ◐ Partial ◌ Not included

	1 · Intelligence platform Smallest starting point	2 · Enterprise data & AI Pwin, price-to-win, leads, market	3 · Full operating platform Everything in the Reference sheet
TECHNOLOGY LAYERS			
Interface	● Bid, pricing and contract workspace	● **Market and pipeline dashboards**	● **Sales, client and executive views**
Access & AI agents	● Per-person permissions, ChatGPT and Claude, audit	● Same as option 1	● **Autonomous scheduled agents**
Business logic	● Staffing and pricing engine, approvals	● **Pwin scorecard, price-to-win, lead scoring**	● **Outreach sequences, records-request follow-up**
AI services	● Extraction, drafting, meaning-based search	● **Model insights on scores**	● **Agent automation at volume**
Processing	● OCR pipeline, key portal crawlers, document output	● **More portals, continuous crawling**	● **24/7 crawling and enrichment**
Integrations	● Procurement sites, Drive, QuickBooks, Belfry files	● **USAspending, SAM.gov, wage determinations, bid tabs**	● **Apollo / ZoomInfo, Gmail, review and search-visibility tools**
Operational data	● Verified facts, history, outcome capture	● **Staging environment, point-in-time recovery**	● Same as option 2
Analytics	◐ Metrics and comparisons in the database	● **BigQuery warehouse, Pwin and price models**	● **Marketing, client and expansion analytics**
Operations	● Backups, monitoring, alerts	● **Staging + production, recovery**	● **Agent cost and safety limits**
END RESULTS DELIVERED			
Stronger proposals	● Data-driven drafting, compliance, pricing	● **Plus Pwin and price-to-win guidance**	● Same as option 2
Find & convert business	◐ Opportunity discovery and watchlists	● **Market analysis, recompete calendar, scored leads**	● **Outreach and conversion tracking**
Protect revenue & clients	● Contracts, renewals, billing reconciliation	● **Plus profitability analytics**	● **Client reviews and reputation**
Strengthen capability	◐ Past performance and credentials	◐ **Eligibility gaps against the market**	● **Partners, expansion, training academy**
Reusable intelligence	● Every bid feeds the next	● **Plus forecasting from history**	● **Agents do recurring work**

1 · Intelligence platform

Replaces the spreadsheet. Documents are read automatically and checked by staff; competitor awards, pricing and proposals are built from verified data; every bid outcome is recorded.

BUILD	RUN COST	LOAD HISTORY
3–6 months	$150–400/mo	$60–400 once

Pros

- Fixes the AI-reading problem with one queryable source
- Delivers proposals, pricing and contract protection
- Starts capturing outcome data that options 2 and 3 need

Cons

- Pwin, leads and market analysis stay manual
- Staff time to verify extracted facts
- Largest single build stage

2 · Enterprise data & AI

Adds a BigQuery warehouse and public market data: Pwin scoring, price-to-win, recompete calendar, market analysis and lead scoring.

BUILD	RUN COST	MODELS
+3–6 months	$400–1,100/mo	Gated on data

Pros

- Price-to-win from public wage, award and bid data
- Market share, competitors and recompete dates
- Pwin and lead scores on every opportunity

Cons

- Statistical Pwin needs ~300 recorded outcomes
- Point-in-time backups and staging add cost
- Texas bid tabs often need records requests

3 · Full operating platform

Adds sales and marketing effectiveness, client reviews and reputation, credentials and expansion tracking, and AI agents that run scheduled work on their own.

BUILD	RUN COST	PAID DATA
+3–6 months	$1,000–2,600/mo	+ quotes

Pros

- Covers every result in the Reference sheet
- Outreach and inbound tracked to real customers
- Agents handle follow-ups and recurring research

Cons

- Highest cost; Apollo API and ZoomInfo are quote-only
- Autonomous agents need tight cost and safety limits
- Most for one builder to run

Run costs VERIFIED are built from official list prices (Vercel, Supabase, Google Cloud Run, BigQuery, Vertex AI, Document AI, Sentry, Resend, Apollo) with stated usage assumptions, excluding staff time. Option 3 excludes Apollo's API plan and ZoomInfo, which are quote-only. Build times ESTIMATE assume one developer.

What ships first, and what waits for data

Scoring can start right away as rules; statistical models become reliable only once enough outcomes are recorded. That's why outcome capture starts in Option 1.

CAPABILITY	SHIPS FIRST AS	UPGRADES TO	WHAT IT NEEDS
Pwin	Weighted scorecard (incumbency, relationship, price position, past performance, competition), the standard capture practice	Calibrated statistical model, then machine learning	~300 bids with recorded outcomes supports only ~3–9 predictors; ML needs ~150–300+ recorded wins
Price-to-win	Should-cost plus competitor benchmarks	Ranges tuned by recorded bid outcomes	Public data: wage determinations, GSA price lists, award values, Texas bid tabulations. Doesn't depend on L&P's win history
Lead scoring	Rules: fit plus trigger signals (expiring contract, new facility, RFP issued)	Predictive scoring	Logged lead outcomes; Salesforce's model requires ≥1,000 leads with ≥120 conversions
Market analysis	Market size, competitor share, recompete calendar	Trends and forecasts	USAspending, SAM.gov, BLS wage data, Texas ESBD, all free

Sample size: Riley et al., BMJ 2020; Peduzzi et al. 1996 (10 events per variable). Lead scoring: Salesforce Einstein guide. Pwin practice: Shipley, Unanet and Loopio documentation. The predictor counts are our approximation of Riley's criteria.

6 · RECOMMENDED PATH

Build 1, then 2, then 3, each proving itself before the next

OPTION 1 · ~3–6 MONTHS

One trusted source

Document pipeline, verified records, pricing and proposal engines, contracts, ChatGPT and Claude connected, outcome capture on every bid.

Proof: one real bid end to end; agents answer from the database, not the sheet.

→

OPTION 2 · +3–6 MONTHS

Market and pricing intelligence

Warehouse, public market data, Pwin scorecard, price-to-win, lead scoring, recompete calendar.

Proof: every open opportunity shows a Pwin score and a price range with sources.

→

OPTION 3 · +3–6 MONTHS

Full operating platform

Sales and marketing tracking, client reviews and reputation, expansion tracking, autonomous scheduled agents.

Proof: agents complete recurring work with a full audit trail.

7 · DECISIONS

What we need to decide together

DECISION	OPTIONS	RECOMMENDATION
Target scope	Option 1 · 2 · 3	Option 3 as the destination, built in order 1 → 2 → 3
First priority	Proposals · pricing · leads · contracts	Proposals and pricing: one real bid end to end
Outcome capture	Start now, or when models are built	Start now, and backfill past bids. Pwin and price-to-win depend on it
Cloud scope	All Google Cloud, or Google Cloud + managed app services	Google Cloud for heavy work and analytics; managed app services for speed; standard PostgreSQL keeps an all-Google move open
Paid data	Apollo (API is quote-only) · ZoomInfo (quote-only) · public data only	Public data first; get Apollo and ZoomInfo quotes before Option 3

How this was checked: the Data Index sheet was measured directly; market volumes come from official USAspending and SAM.gov queries; costs come from official pricing pages (us-central1 list prices, 15 Oct 2026); modeling guidance comes from published research and vendor documentation. Context-window sizes are from secondary sources and vary by plan.
